

Exercise 12: Robot Application

Winter Term 2018/19

In this last exercise, you should be developing a real-world, robot application. You can choose from two different robots, Khepera and a the e-Puck robot.

The application should be complete in that it contains a main-window and *optionally* menus, a toolbar as well as a statusbar. Also, the program should feature the required functionality. Furthermore, a usability might be a main key point of your design and development.

The implementation of your application is being supported in that the class' home page <http://www.imd.uni-rostock.de/ma/rs/lv/lvgui.html> provides some low-level Qt classes as well as the documentation.

Have fun, Theo and Ralf
