

Exercise 5: Qt - Tutorial, Chapter 1-3

Winter Term 2018/19

In this exercise, you will be learning the basics of Qt programming. The first three chapters introduce the *signal-and-slot* mechanism.

The complete tutorials, including the description and source files, are available at `/opt/lehre/qt-tut/qt-tut.zip`. The top-level file of the tutorials is called `html/tutorial.html`.

To compile a program, do the following steps:

1. Download the tutorial sources and store them in a directory of your choice.
2. Change to that directory by using the command `cd <directory-name>` in a shell.
3. Unpack the material by using `unzip tutorials.zip`.
4. Go to the directory of a tutorial you are interested in. There, type `qmake` and then `make`.

Work through the first three chapters.

Modify the tutorial program in a way that the `hello-window` appears again after the first close and that the program terminates after the second one.

Have fun, Theo and Ralf
